

Using Community Prescribed Drug Data to Predict Emerging Pollutants

Moyra McNaughtan
Joanne Roberts
John MacLachlan

Introduction

- ~3000 pharmaceutical products are permitted for use in Europe.
- Not all are completely absorbed or metabolised.
- Product and/or metabolites partially excreted and therefore reach the water cycle.
- Not all are removed by waste water treatment.

Pharmaceuticals in the Environment

- Many studies worldwide have been carried out to measure pharmaceuticals in the environment.
- But with limited resources:
 - which pharmaceuticals should be targeted?
 - which are of most concern, both now....
.....and in the future?

Aims

- Review community prescription data in Scotland 2009-2014.
- Identify trends in prescription patterns, e.g. increase in use of statins.
- Consider metabolites and breakdown products.
- Link usage data with known or predicted ecotoxicity.
- Produce “short-list” of drugs for environmental monitoring.

Top Prescribed Drugs Scotland 2009-2014

Information Services Scotland, (2014). Prescribing & Medicines: Prescription Cost Analysis.

Drug Load - antihypertensives

Drug Load

Donepezil

- Acetylcholinesterase inhibitor used in treatment of dementia.
- Number of people in UK with dementia predicted to increase to 1 M by 2021.
- Donepezil load (2001-2014) increased x18, although still relatively low.

Drug Load - Donepezil

Identified Trends

- Rapid increase in load of simvastatin and omeprazole.
- Omeprazole now available without prescription.
- Carbamazepine load fairly constant.
- Slight decrease in atenolol load with corresponding increase in propranolol.
- Increase in donepezil load predicted to continue.

Lidocaine

Lidocaine

- Injectable – 95% of the dose is metabolised.
10 mg dose – 0.5 mg lidocaine excreted.
- Gels, creams & ointments – only 5% of the dose is absorbed.
1 ml application of 5% gel equivalent to 50 mg
– 47.5 mg could be washed off.
- Could the increase in use of gels result in higher loads reaching waste water?

Environmental Toxicity

- Direct comparison of data difficult.
- Large variation depending on models used, e.g. PEC/PNEC, ECOSAR
- Metabolites and breakdown products rarely studied.

Carbamazepine

- Known to be persistent in environment.
- Excreted mainly as metabolites:

16% CBZ

71% DiOHCBZ

2.1% CBZEP

CBZ – carbamazepine

DiOHCBZ - 10,11-dihydro-10,11-dihydroxy carbamazepine

CBZEP - 10,11-dihydro-10,11- epoxy carbamazepine

Carbamazepine ECOSAR

| | | | Carbamazepine mg/L | DiOH CBZ mg/L | CBZEP mg/L |
|-------------------|----------------|-----|-----------------------|------------------|---------------|
| Substituted ureas | Fish | ChV | 0.901 | 66.408 | 8.744 |
| Substituted ureas | Daphnid | ChV | 1.171 | 100.0 | 12.289 |
| Substituted ureas | Green Algae | ChV | 0.130 | 0.929 | 0.366 |

- Indicates metabolites less toxic than parent drug.

Omeprazole

- Pro-drug
- Excreted mainly as metabolite:

Omeprazole

5-hydroxyomeprazole

- Both known to be unstable in acid conditions

Omeprazole ECOSAR

| | | | Omeprazole mg/L | 5-hydroxyomep mg/L |
|------------|-------------|-----|-----------------|--------------------|
| Imidazoles | Fish | ChV | 0.1 | 0.018 |
| Imidazoles | Daphnid | ChV | 0.092 | 0.021 |
| Imidazoles | Green Algae | ChV | 0.384 ! | 0.125 ! |

- Metabolite more toxic than parent drug.

! = exclamation designates: The toxicity value was estimated through application of acute-to-chronic ratios per methods outlined in the ECOSAR Methodology Document provided in the ECOSAR Help Menu.

Simvastatin

- Pro-drug with complex metabolism.
- Major active metabolite is beta-hydroxy-acid of simvastatin.
- Simvastatin may be unstable in sewage conditions.

Simvastatin

Simvastatin acid

Simvastatin

| | | | Simvastatin mg/L | Simvastatin Acid mg/L |
|--------|-------------|-----|------------------|-----------------------|
| Esters | Fish | ChV | 0.029 | 0.188 |
| Esters | Daphnid | ChV | 0.308 | 1.855 |
| Esters | Green Algae | ChV | 0.209 | 1.455 |

- Metabolite less toxic than parent drug.

Donepezil

- Excreted mainly in un-metabolised form (57% in urine).
- Environmental load predicted to increase in line with increase in prescribed load.
- More toxicity data required.

Short-list

- Atenolol
- Simvastatin
- Omeprazole
- Donepezil
- Lidocaine
- Carbamazepine

Future Work

- Two WWTPs identified in Central Scotland:
 - One trickling filter, one activated sludge.
 - Serve similar populations.
- Sample influent and effluent at both WWTPs.
- Determine elimination of each drug at WWTPs.
- Determine the degradation products and metabolites for selected drugs.
