

Projecting LULC growth and associated impacts on hydrological process through scenario-based modelling – A road ahead for sustainable future

Presented by:
Srishti Gaur

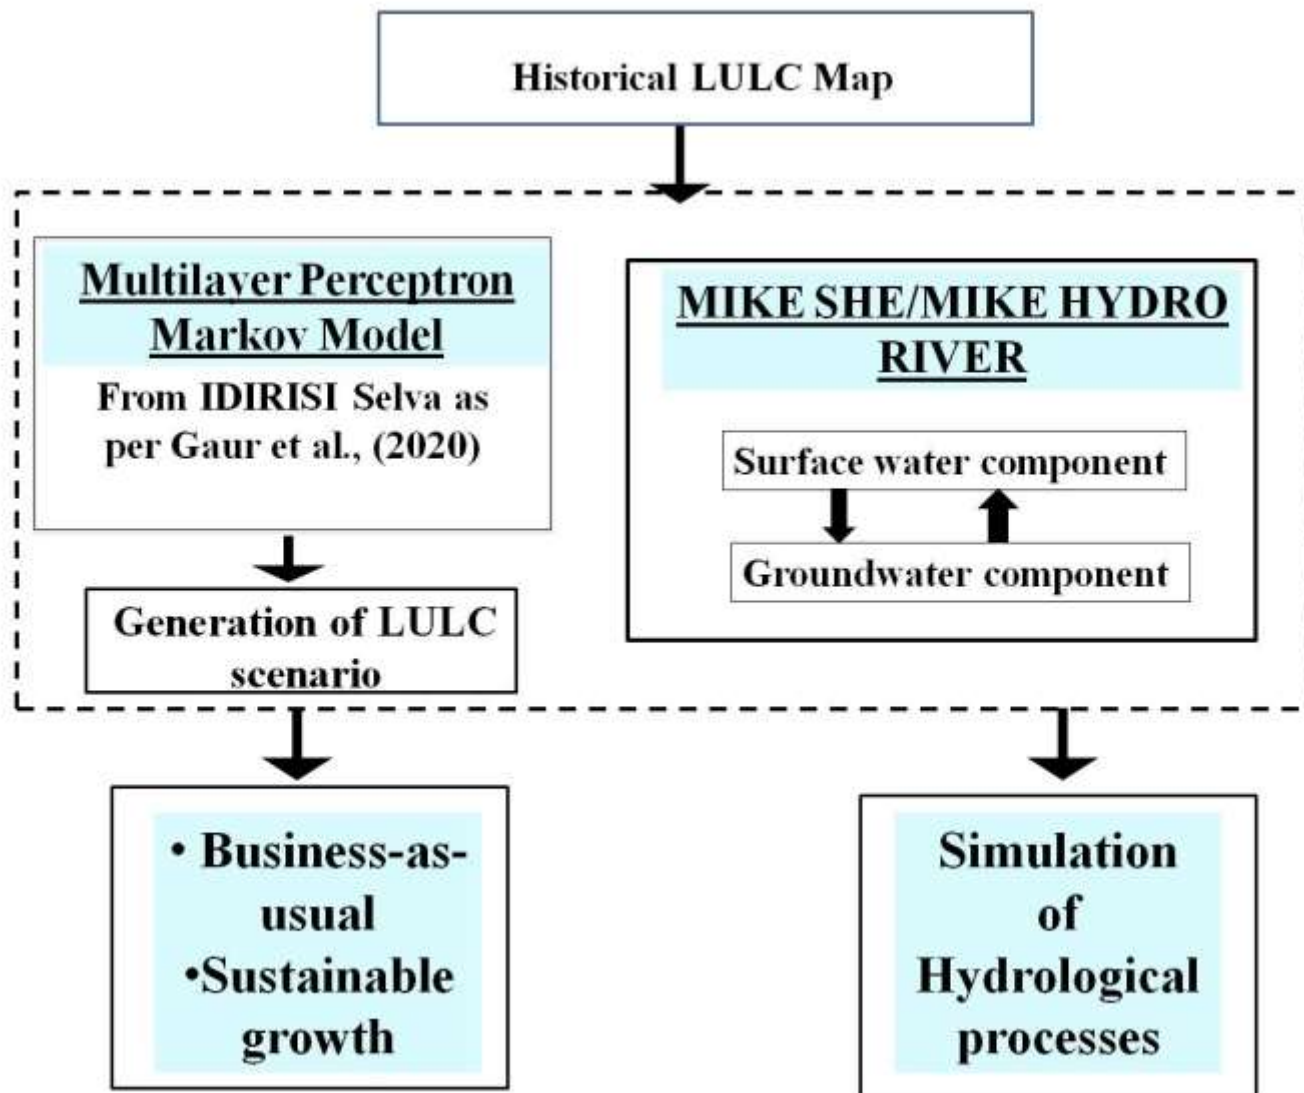

“One Water, One Health: Water, Food and Public Health in a Changing World”

7-9 June 2021

Introduction

- ❖ India has experienced **significant** land use and land cover (LULC) changes, including urbanisation, deforestation, agricultural expansion, and industrialisation.
- ❖ The development of land resources may **strengthen** economic productivity but simultaneously affect the **sustainability** of the natural resources.
- ❖ **Scenario analysis** and modelling have been recognised as robust tools for understanding the mechanism of probable LULC changes.
- Integrating the LULC scenarios in planning and management is gaining momentum for **anticipating future landscapes different pathways, allowing exploring the options to reach specific goals.**

Methodology

Study Area

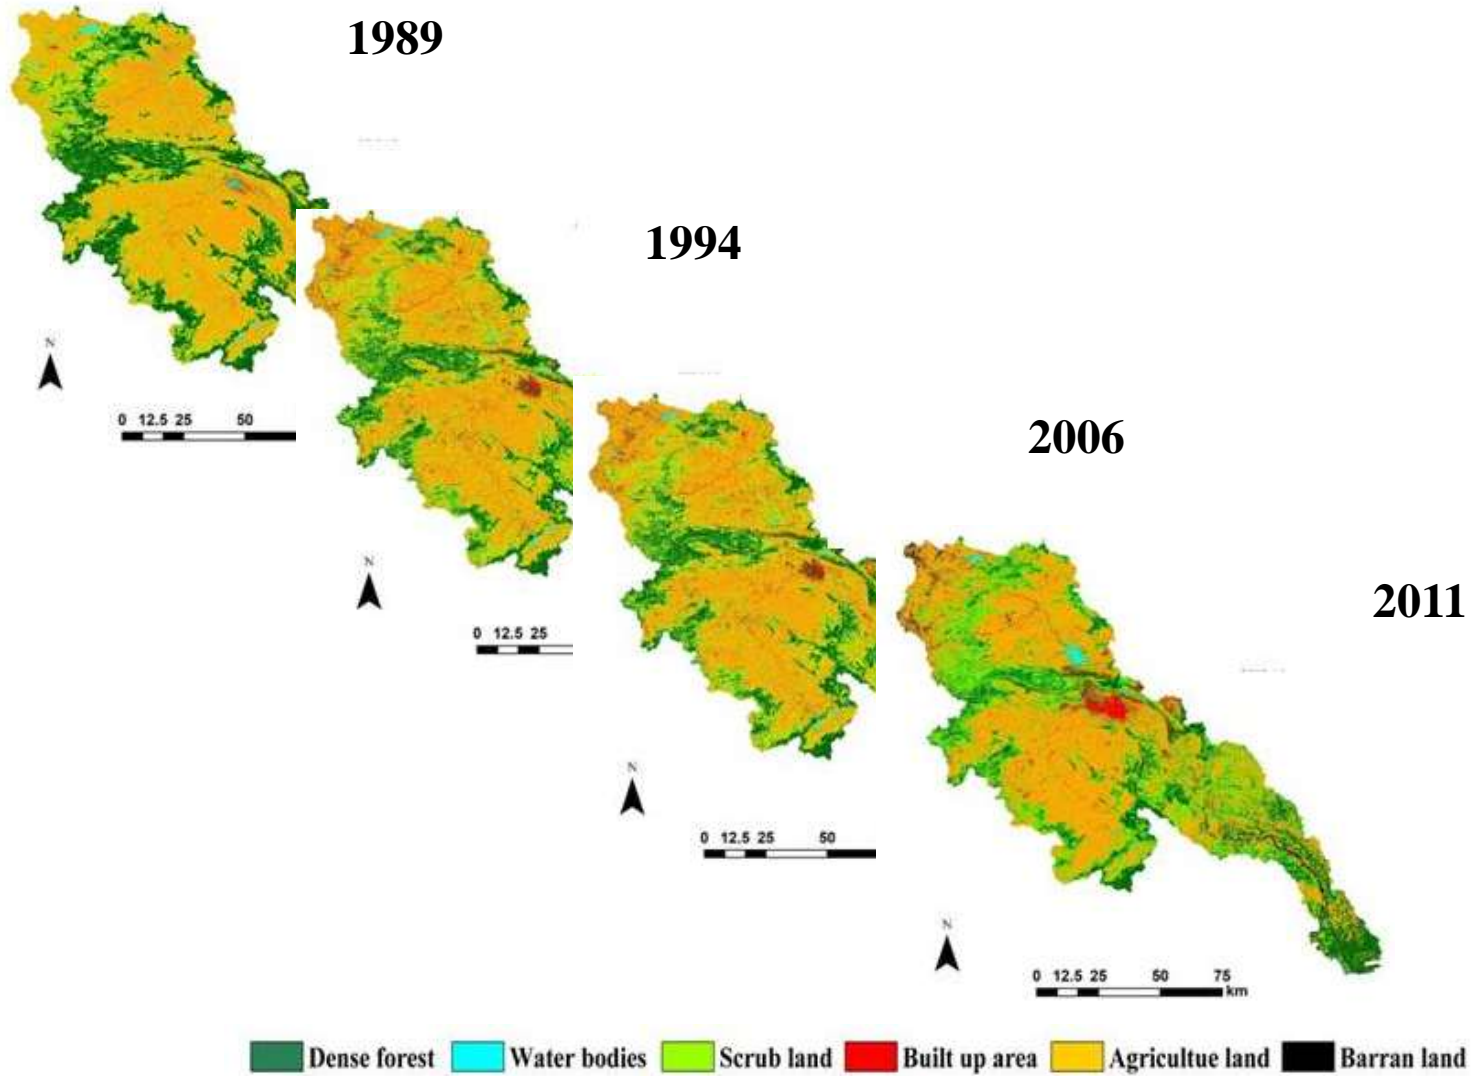

□ Subarnarekha River

Over the past few decades the basin has subjected to deforestation, urbanization and industrialization

LULC Monitoring

Methodology

LULC Scenarios

❖ In the case of the BAU scenario, the historical LULC persists for the future periods, i.e., future LULC will follow the historical LULC trends

❖ A sustainable growth scenario has been developed by considering the sustainable development goal-15, i.e., life on land

❖ Following the SDG-15 goals, India has planned to bring 1/3rd of the land under forest cover (Kant *et al.* 2008). Therefore, our scenario aims at increasing the forest cover by 7% by 2030 mainly on the Scrublands.

BAU Scenario

Results

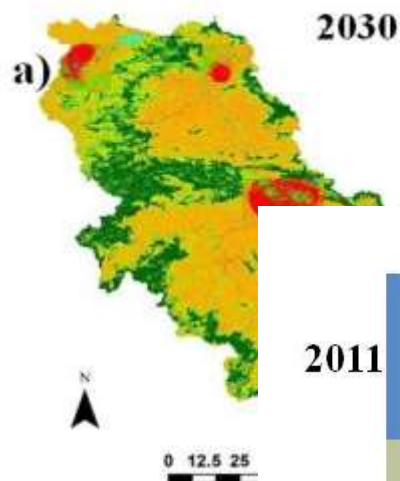

| | ET | OF | Runoff | Inf | |
|------|-----|-----|--------|-----|-----------|
| 2011 | 733 | 183 | 215 | 96 | High (mm) |
| 2030 | 716 | 190 | 219 | 87 | |
| 2040 | 710 | 192 | 222 | 85 | |
| 2050 | 713 | 198 | 223 | 79 | Low (mm) |

Dense forest
 Water bodies
 Scrublands
 Built-up area
 Agricultural land
 Barran land

SG Scenario

Conclusions

- ❖ The predicted LULC under BAU scenario would lead to the expansion in built-up area and scrubland along with decrease in the magnitude of dense forest and agricultural land over 2030-2050.
- ❖ Consequently, increased overland flow (3.8%-8.2%) and runoff (3.7%-1.9%) and decreased Evapotranspiration (2.3%-3.1%) and infiltration (9.3%-17.7%) are obtained as compared to baseline period (2011).
- ❖ The findings obtained from SG scenario lead to reforestation over the basin over 2030-2050.
- ❖ Consequently, the forested areas generated low overland flow (1.6%-6.6%) and runoff (1.9%-9.3%) with higher infiltration (4.2%-15.6%) and Evapotranspiration (0.9%-2.6%).
