and Ecosystems

# Impacts of the implementation of SDG 6.4 on global food security

Hua Xie with Claudia Ringler & Tingju Zhu

---

XVIII World Water Congress Beijing - China

September 11-15, 2023

# Introduction

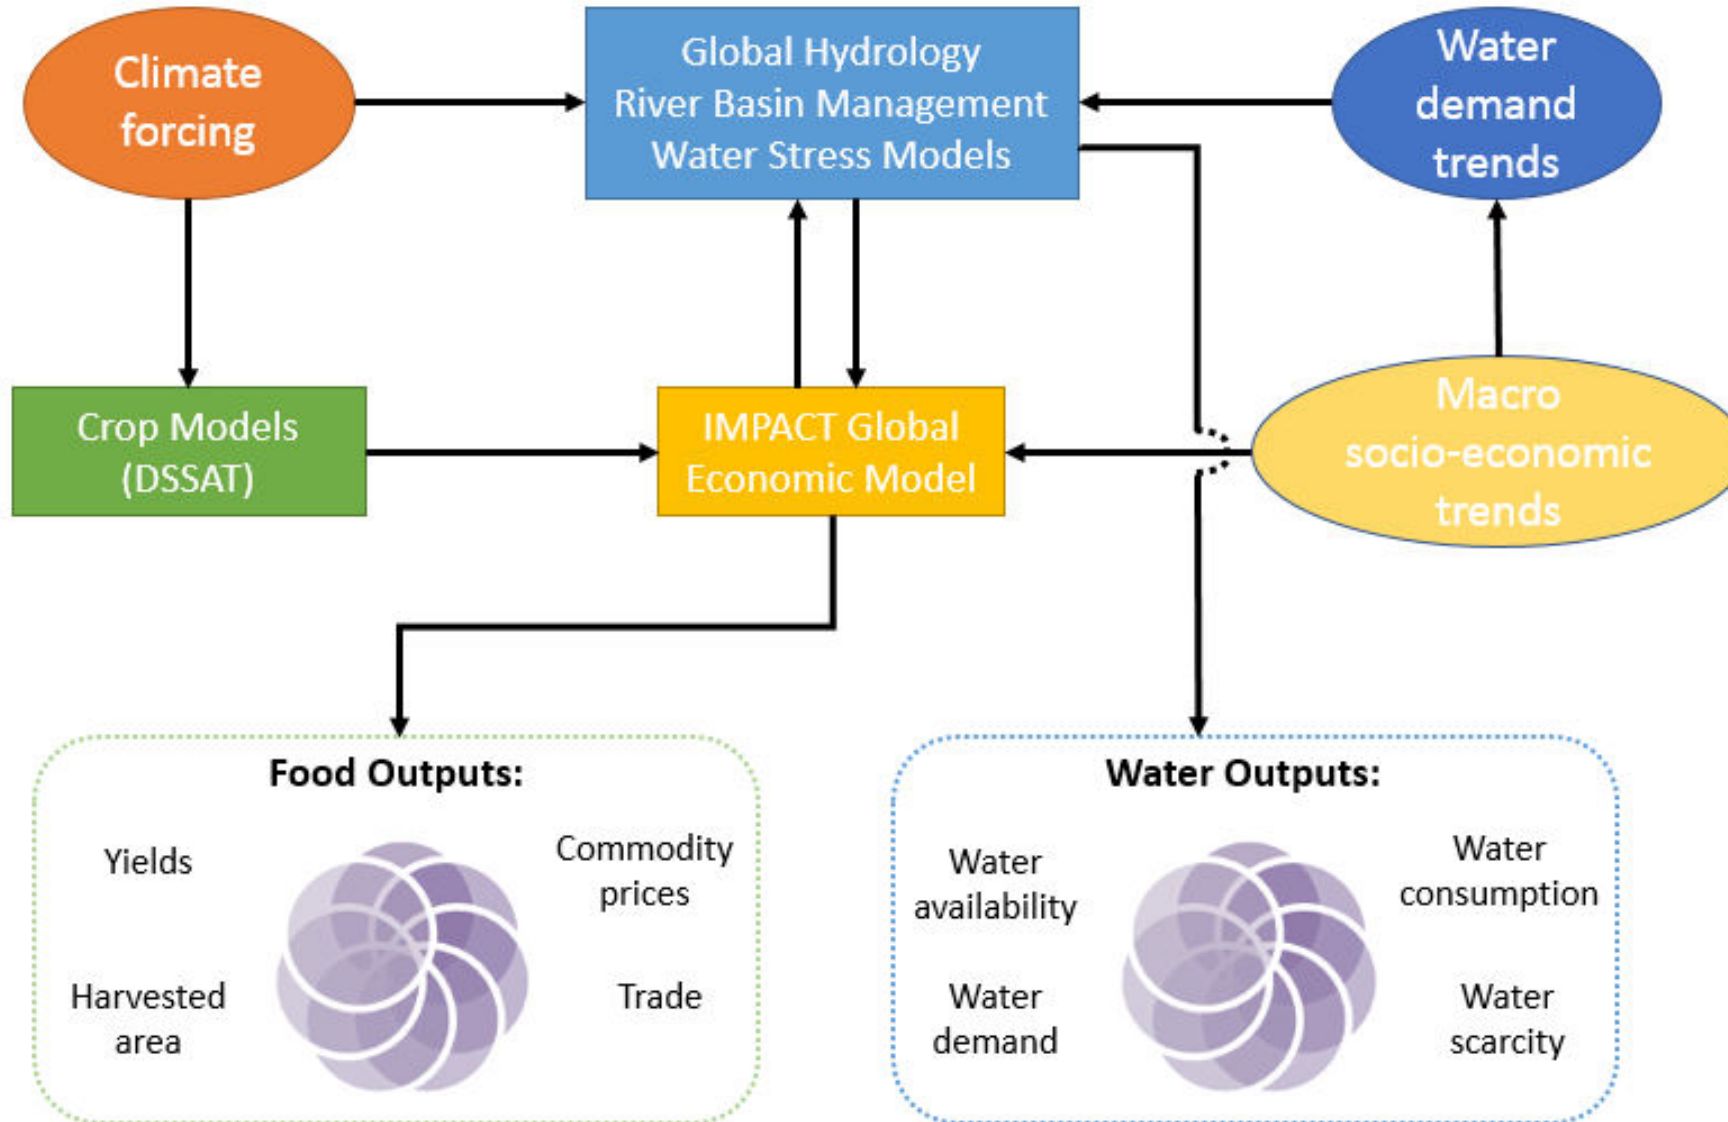

NEXUS Gains:  
Realizing Multiple Benefits  
Across Water, Energy, Food  
and Ecosystems

- Irrigation has helped reduce prices of key staple crops, in particular rice and wheat, and has thus been an important contributor to reducing the number of people at risk of hunger or undernourished population
- Irrigation has also helped save large forest areas from deforestation as crop yields are substantially larger on irrigated plots and plots are often double- or even triple-cropped
- But irrigation has critically increased water depletion and degradation (pollution)
- To address this, SDG6.4 aims to, "By 2030, substantially increase water-use efficiency across all sectors and ensure sustainable withdrawals and supply of freshwater to address water scarcity and substantially reduce the number of people suffering from water scarcity"
- How do alternative irrigation management investments and options affect food security, including improvements in water use efficiency?

# International Model for Policy Analysis of Agricultural Commodities and Trade (IMPACT)

NEXUS Gains:  
Realizing Multiple Benefits  
Across Water, Energy, Food  
and Ecosystems

# Challenges in modeling Irrigation Efficiency (IE)

NEXUS Gains:  
Realizing Multiple Benefits  
Across Water, Energy, Food  
and Ecosystems

## Accounting for water

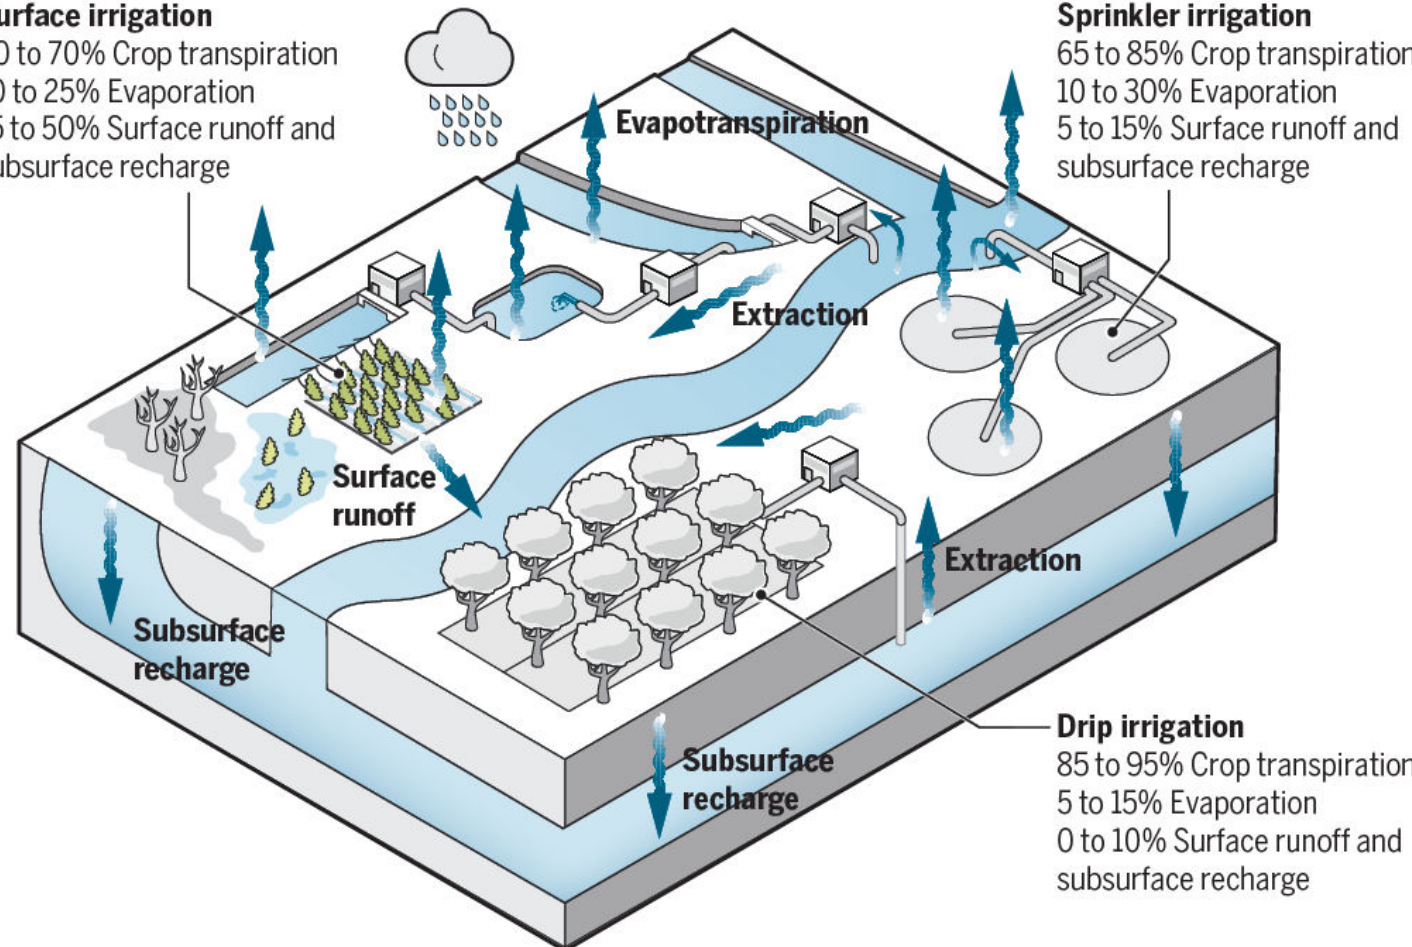

The paradox of irrigation efficiency (surface, sprinkler, and drip) and the water inflows and outflows can be seen in a watershed example. Ranges of crop transpiration, evaporation, runoff, and recharge are authors' judgment of possible values. These values depend on crop and soil types, weather, and other factors.

### Surface irrigation

40 to 70% Crop transpiration  
10 to 25% Evaporation  
15 to 50% Surface runoff and subsurface recharge

### Sprinkler irrigation

65 to 85% Crop transpiration  
10 to 30% Evaporation  
5 to 15% Surface runoff and subsurface recharge

### Drip irrigation

85 to 95% Crop transpiration  
5 to 15% Evaporation  
0 to 10% Surface runoff and subsurface recharge

# Irrigation Efficiency (IE)

$$\text{Classical Irrig Efficiency [IE]} = \frac{\text{beneficial crop ET}}{\text{water delivered to the field}}$$

$$\text{Effective IE} = \frac{\text{beneficial crop ET}}{\text{water delivered to the field} - \text{return flows}}$$

$$\text{Economic Effective IE} = \frac{\text{net profits}}{\text{water delivered to the field} - \text{return flows}}$$

Keller and Keller (1995)

**IFPRI IMPACT Model: Effective Efficiency at Basin Scale (Basin Efficiency)**

# Scenarios

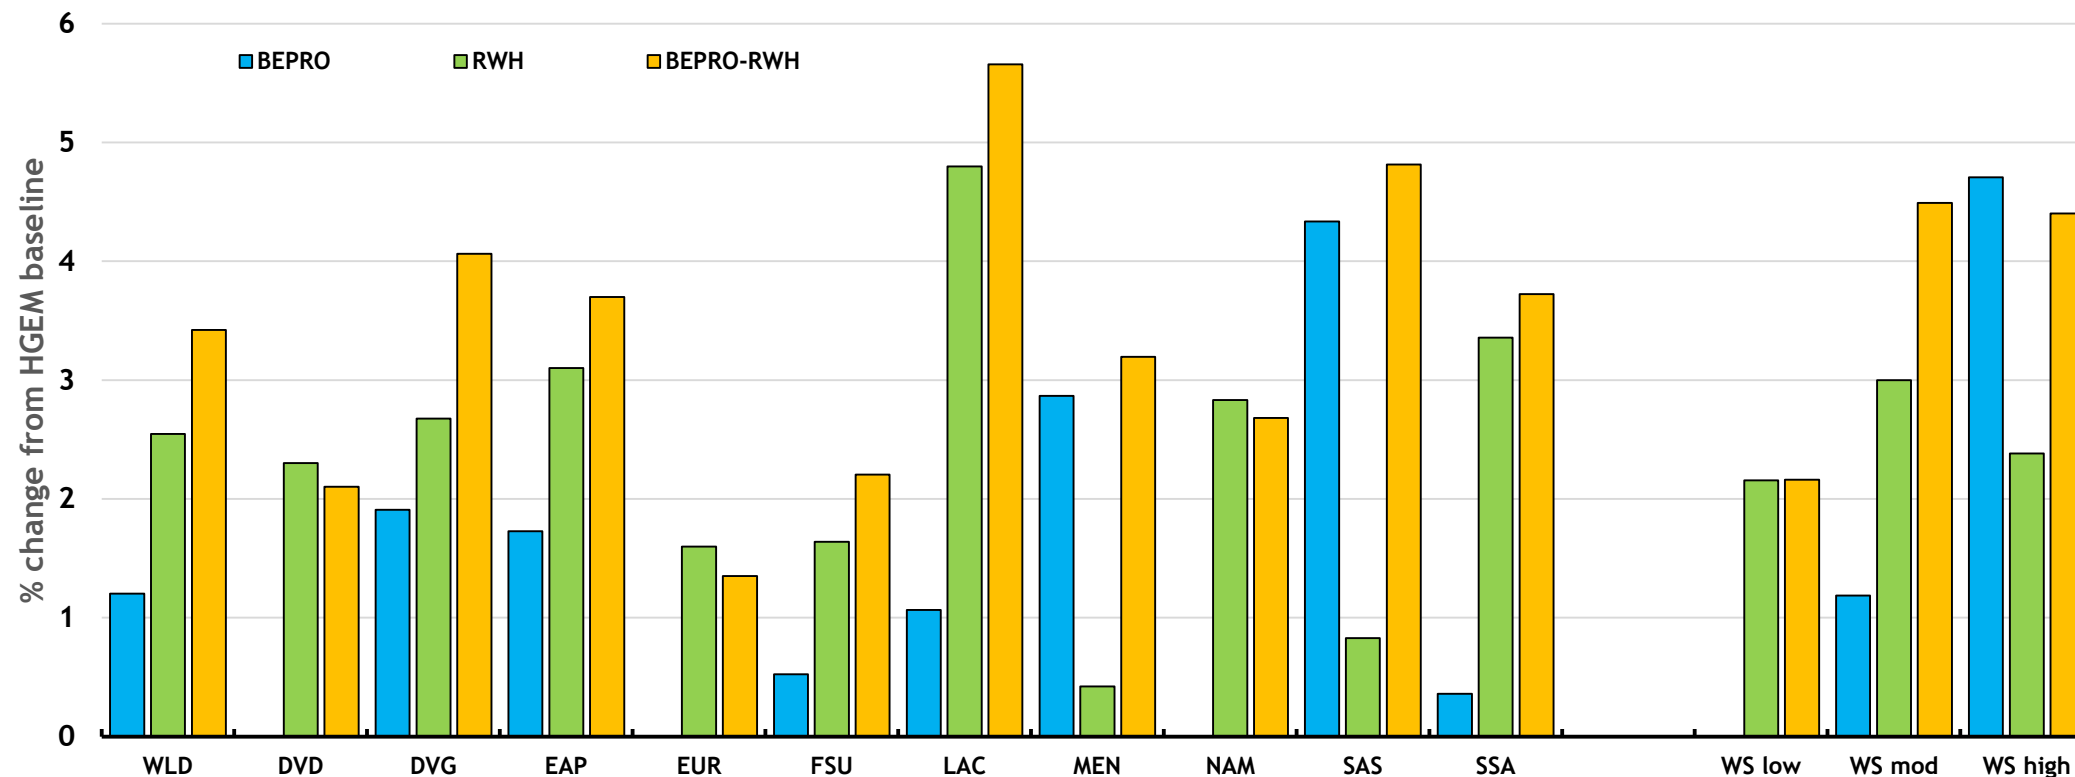

NEXUS Gains:  
Realizing Multiple Benefits  
Across Water, Energy, Food  
and Ecosystems

Scenario name	Implementation
Baseline CC	Business-as-usual with climate change [RCP 8.5 and average of 3 climate scenarios]
Basin Efficiency Improvement (BEPRO)	Gradual improvements in effective basin efficiency in LMICs by 0.15 by 2030 compared with a cap of 0.85 by 2050
Enhancing Rain Water Harvesting (RWH)	For areas with aridity index < 0.65, gradual increase in effective use of rainfall by 15% during 2015-2030, and continuation at the 15% level thereafter; for the rest, gradual increase of 10% during 2015-2030, continuation at the 10% level thereafter
BEPRO & RWH	Aggregates BEPRO & RWH

# Changes in projected cereal yields, by region, including in low, moderately and highly water stressed regions

NEXUS Gains:  
Realizing Multiple Benefits  
Across Water, Energy, Food  
and Ecosystems

WLD-World      DVD-Developed countries      DVG-Developing countries      EAP- East Asia and Pacific      EUR-Europe      FSU- Former Soviet Union

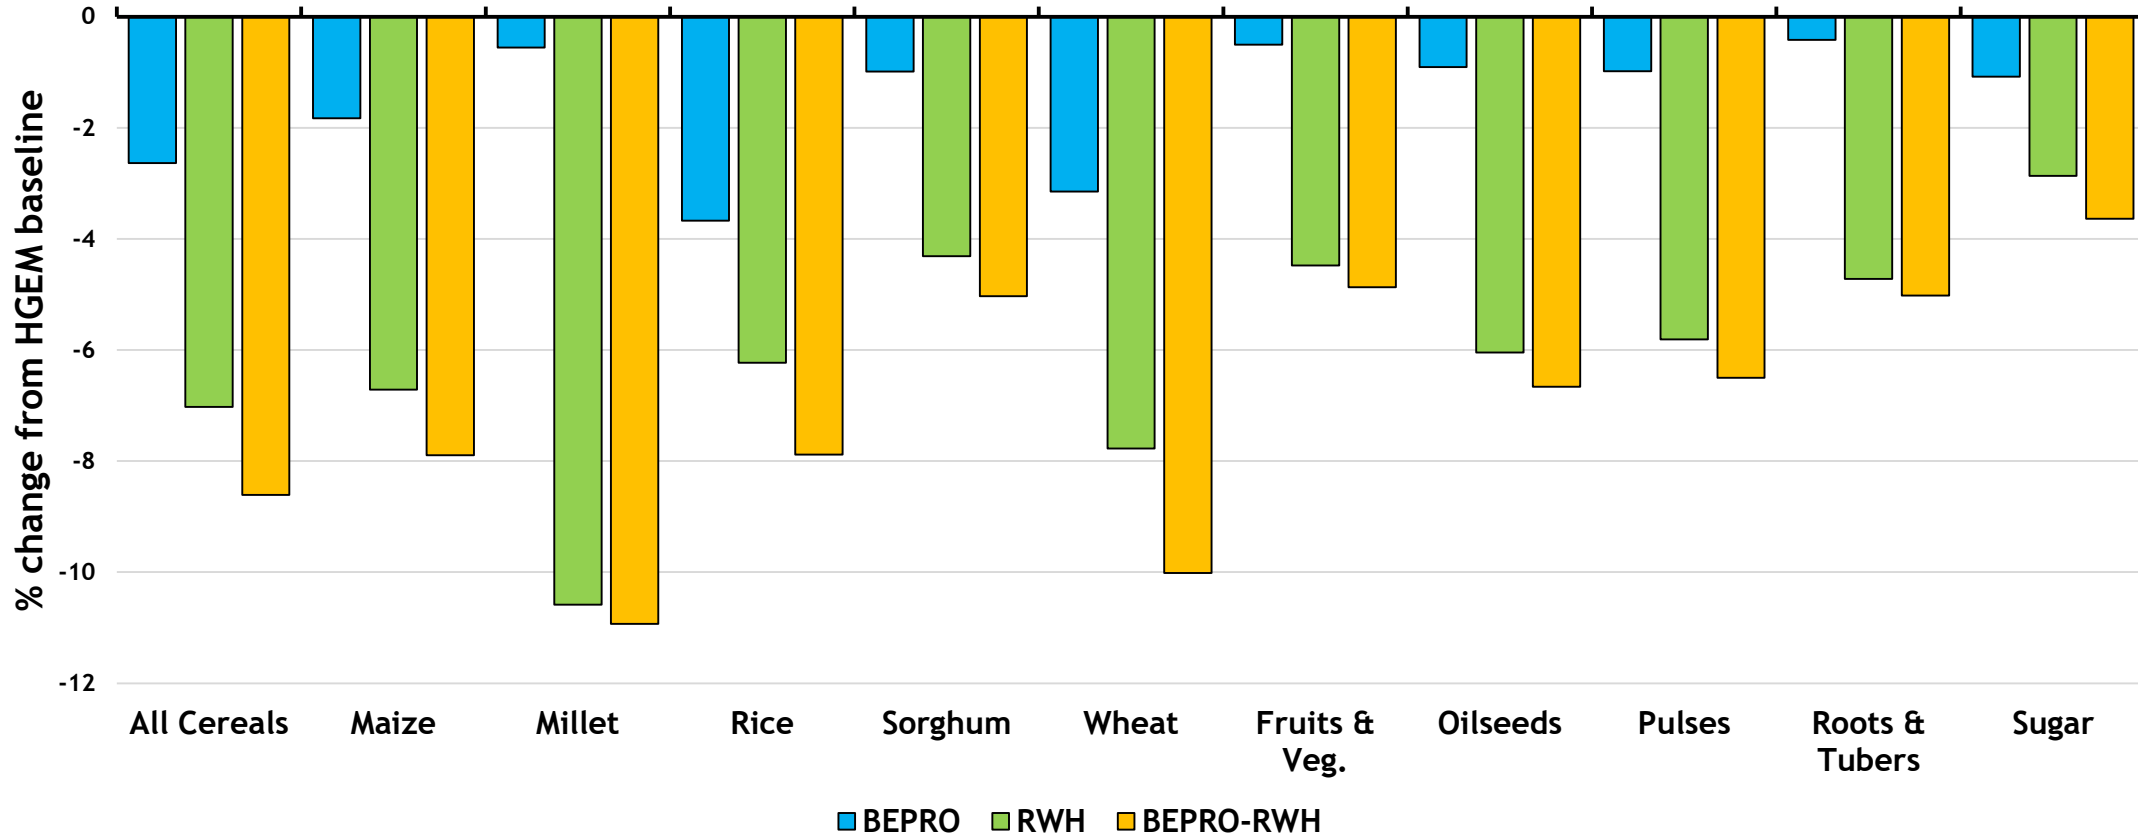

LAC- Latin America and Caribbean      MEN-Middle East and North Africa      NAM-North America      SAS-South Asia      SSA-Africa south of the Sahara

WS-water stress

# Changes in projected world prices from alternative WUE scenarios

NEXUS Gains:  
Realizing Multiple Benefits  
Across Water, Energy, Food  
and Ecosystems

# Summary

NEXUS Gains:  
Realizing Multiple Benefits  
Across Water, Energy, Food  
and Ecosystems

- WUE improvements boost agricultural production
- The increased food production due to WUE improvements brings down global food price by up to 10% and enhances food affordability
- The implementation of SDG6.4 can support global food security

NEXUS Gains:  
Realizing Multiple Benefits  
Across Water, Energy, Food  
and Ecosystems
